Greetings

Welcome Message from the General Chair

Greetings!

It is our great pleasure and honor to welcome you to APCC 2016, the 22nd Asia-Pacific Conference on Communications and also to our beautiful Yogyakarta, the center of Javanese arts and culture. In this event we will have the opportunities to exchange knowledge and information on latest researches and strengthening relationships amongst us, while enjoying the relaxing yet entertaining environment of Yogyakarta.

Since 1993, APCC has been acknowledged as technical forum for researchers and engineers to interact and disseminate information on the latest developments in advanced communication and information technologies, particularly in the Asia-Pacific region. In this 22nd APCC, the event is organized by IEEE Communication Society Indonesia Chapter, supported by Telkom University and University of Gajah Mada, as Co-Organizers. APCC 2016 is made possible through the technical co-sponsorship of the IEICE Communication Society, KICS and CIC.

Many advance technologies in the communication field, start to put the intelligences in many segments and subsystems of a communication system. Novel methodologies and approaches are introduced to achieve higher level of communication quality. Nevertheless, human life is still a very important aspect to be considered in each development of technologies, including communication technology. Today, we have witnessed the rise of broad smart digital technologies on the devices, sensors, networks, controls and not to mention millions of applications. Those smart technologies spun from computing, broadcasting and media, platforms, applications and contents, advertising and social media. Accordingly, under the theme of “Advancement of Science, Technology and Applications in Communications for Humanity”, APCC 2016 will provide opportunity for us to discuss these issues. Still, there are many challenges need to be resolved, including technology, infrastructure, traffic, spectrum, privacy/security, energy-efficiency, nature-friendly development, life style changes, and others.

In APCC 2016, we are honored to have several distinguished Keynote Speakers around the world. Other APCC 2016 point, there is high interest on 5G and IoT as the advance topics in communications nowadays. During this event, we are also delighted to have valuable tutorials delivered by experts.

We hope all participants will have valuable and also enjoyable experience during this event. Looking forward to see you all in Yogyakarta.

General Chair
Wiseto Agung
Telkom Indonesia

Greetings

Welcome Message from TPC Chair

Dear Ladies and Gentlemen,

It is a great honor for all of us to host the APCC 2016, the 22nd Asia-Pacific Conference on Communications, in Yogyakarta, where the high qualified papers in advanced information and communication technologies and services, under the theme of “Advancement of Science, Technology and Applications in Communications for Humanity”, will be presented. The conference received 297 papers from 828 authors of 29 countries and through high qualification of reviewing process and tight registration process APCC 2016 accepted 126 papers from 401 authors of 24 countries with high qualified papers.

The research in advanced information and communication technologies and services, and also communications networks with advanced technologies are very important since it brings us insight into new engineering solutions that may influence our life. This event represents a great achievement in topics of interest, which the best contributors coming from excellent laboratories and schools throughout the world, precipitate to come and contribute their finest works. Therefore, this conference will become the landmark for engineering society to express their thoughts and skills in finding best algorithms or modern mathematical modeling for the future technology. Not only the high qualified papers, the conference is supported by 6 experts in tutorial sessions and 9 distinguished experts in keynote sessions.

We would like to express special appreciation for 702 technical program committee (TPC) that supported the review process, thus enable us to present high qualified conference in communications technology. The top 7 demanding topics from background of reviewers background are IoT Communication and Networking Protocols (279 reviewers); IoT Enabling Technologies (228 reviewers); Network Architecture and Protocol (225 reviewers); Future Network (219 reviewers); IoT System Architecture (219 reviewers); Services and Applications (215 reviewers); Wireless System (211 reviewers).

Welcome to Yogyakarta, we hope that you enjoy the foods, graceful palace, arts, its tropical beauties and richness culture. We hope that fruitful discussions and exchange of ideas between researchers during conference will yield new technological innovations for contributing to a better life for humans in the coming decades.

Best regards,

TPC Chair,
Rina Pudji Astuti

Committees

APCC Steering Committee

Prof. Masahiro UMEHIRA, Ibaraki University
 Prof. Daehyoung HONG, Sogang University
 Prof. Xinsheng Zhang, CIC
 Prof. Qian Mao, Wuhan research institute of Posts & Telecommunications
 Prof. Borhanuddin Mohd ALLI, University Putra Malaysia
 Dr. Yasunori Suzuki, NTT DOCOMO, INC.
 Prof. Dong Ku Kim, Yonsei University
 Dr. Takashi Shimizu, NTT
 Prof. Adnan Al-Anbuky, The Auckland University of Technology
 Prof. Youze Cho, Kyungpook National University
 Prof. Tomoaki Ohtsuki, Keio University
 Prof. Suhono Harso SUPANGKAT, Bandung Institute of Technology
 Prof. Hsiao-Hwa Chen, National Cheng Kung University
 Prof. Kwang Bok Lee, Seoul National University
 Prof. Chi-Chung KO, National University of Singapore
 Prof. Tony T. LEE, Chinese University of Hong Kong
 Prof. Ping ZHANG, BUPT
 Dr. Hiroshi OTA, ITU
 Prof. Sawasd TANTARATANA, Sirindhorn International Institute of Technology
 Prof. Desmond P. TAYLOR, University of Canterbury
 Prof. Apinunt THANACHAYANONT, King Mongkut's Institute of Technology Ladkrabang
 Dr. Dennis N. COOPER, CSIRO Telecommunications & Industrial Physics
 Dr. Ram Gopal GUPTA, India Ministry of Information Technology

Organizing Committees

- Dr. Morio Toyoshima, National Institute of Information and Communications Technology, Japan
- Dr. Mubashir Rehmani, COMSATS Institute of Information Technology, France
- Dr. Muhammad Ali Imran, University of Surrey, United Kingdom
- Dr. Muralidhar Medidi, Georgia Southern University, USA
- Dr. Muthucumar Maheswaran, McGill University, Canada
- Dr. N Nasimuddin, Institute for Infocomm Research, Singapore
- Dr. Nadjib Achir, University of Paris 13, France
- Dr. Nakjung Choi, Bell Labs, USA
- Dr. Natarajan Meghanathan, Jackson State University, USA
- Dr. Nguyen Huu Thanh, Hanoi University of Science and Technology, Vietnam
- Dr. Nicolas Gresset, Mitsubishi Electric Research Centre Europe, France
- Dr. Nikola Zogović, University of Belgrade, Serbia
- Dr. Ning-Hua Zhu, Chinese Academy of Sciences, P.R. China
- Dr. Nirmala Shenoy, Rochester Institute of Technology, USA
- Dr. Osamu Muta, Kyushu University, Japan
- Dr. Oscar Esparza, Universitat Politècnica de Catalunya, Spain
- Dr. Panagiotis Sariiganidis, University of Western Macedonia, Greece
- Dr. Parikshit Mahalle, Singhad Technical Education Society, Smt. Kashiba Navale College of Engineering, Pune, India
- Dr. Paschalios Sofotasios, Tampere University of Technology, Finland
- Dr. Patrik Arlos, Blekinge Institute of Technology, Sweden
- Dr. Paul Ho, Simon Fraser University, Canada
- Dr. Pavel Loskot, Swansea University, United Kingdom
- Dr. Peng Zhao, Xi'an Jiaotong University, P.R. China
- Dr. Peng-Yong Kong, Khalifa University of Science, Technology & Research, United Arab Emirates (UAE)
- Dr. Petr Hanacek, Brno University of Technology, Czech Republic
- Dr. Ping Zhou, Qualcomm, USA
- Dr. Piotr Tyczka, ITTI Sp. z o.o., Poland
- Dr. Pornchai Supnithi, KMITL, Thailand
- Dr. Prahlad Kulkarni, Pune Institute of Computer Technology, Pune, India
- Dr. Qichun Wang, National University of Singapore, Singapore
- Dr. Qifu Sun, University of Science and Technology Beijing, P.R. China
- Dr. Qing Wang, IBM China Research Lab, P.R. China
- Dr. Qingchun Chen, Southwest Jiaotong University, P.R. China
- Dr. Qingjiang Shi, Zhejiang Sci-Tech University, P.R. China
- Dr. Qingsi Wang, Qualcomm Research, USA
- Dr. Quan Zhou, Nanjing University of Posts and Telecommunications, P.R. China
- Dr. Rajarshi Mahapatra, CVR College of Engineering, India
- Dr. Rallis Papademetriou, University of Portsmouth, United Kingdom
- Dr. Ram Gopal Gupta, Ministry of Information Technology and Communications, India
- Dr. Razvan Stanica, INSA Lyon, France
- Dr. Rendy Munadi, Telkom University, Indonesia
- Dr. Ritesh Kalle, HITACHI, India
- Dr. Robert Killey, University College London, United Kingdom
- Dr. Robin Doss, Deakin University, Australia
- Dr. Rongxing Lu, Nanyang Technological University, Singapore
- Dr. Sabu M Thampi, Indian Institute of Information Technology and Management - Kerala, India
- Dr. Salahuddin Zabir, Orange Group, Japan
- Dr. Salama Ikki, Lakehead University, Canada
- Dr. Saman Atapattu, University of Melbourne, Australia
- Dr. Sammy Chan, City University of Hong Kong, Hong Kong
- Dr. Sandra Sendra, Universidad Politècnica de Valencia, Spain
- Dr. Sanjay Singh, Manipal Institute of Technology, India
- Dr. Santiago Mazuelas, Qualcomm, USA
- Dr. Satoshi Denno, Okayama University, Japan
- Dr. Soud Althunibat, Al-Hussein Bin Talal University, Jordan
- Dr. Sayan Ray, Manukau Institute of Technology, New Zealand
- Dr. Selma Boumerdassi, Conservatoire National des Arts et Métiers, France
- Dr. Sen Su, Beijing University of Posts & Telecommunications (BUPT), P.R. China
- Dr. SeongSoo Park, SK Telecom, Korea
- Dr. Sergio Ricciardi, Universitat Politècnica de Catalunya - BarcelonaTech (UPC), Spain
- Dr. Shanzhi Chen, China Academy of Telecommunication Technology, P.R. China
- Dr. Shaoliang Zhang, NEC Labs America, USA
- Dr. Sherali Zeadally, University of Kentucky, USA
- Dr. Sherry Wang, Intelligent Automation Inc (IAI), USA
- Dr. Shi Jin, Southeast University, P.R. China
- Dr. Shinsuke Ibi, Osaka University, Japan
- Dr. Shiqiang Wang, Imperial College London, United Kingdom
- Dr. Shohei Kamamura, NTT, Japan
- Dr. Shoichiro Seno, Tokushima Bunri University, Japan
- Dr. Shuai Han, Harbin Institute of Technology, P.R. China
- Dr. Sivabalan Arumugam, Motorola India Research Labs, India
- Dr. Stefan Mangold, Lovefield Wireless GmbH, Switzerland
- Dr. Steve Weinstein, CTTG Group, USA
- Dr. Sudarshan Gurucharya, University of Manitoba, Canada
- Dr. Sudhir Singh, Callaghan Innovation, New Zealand
- Dr. Sugi Sugihartono, Bandung Institute of Technology, Indonesia
- Dr. Suhartono Tjondronegoro, Institut Teknologi Bandung, Indonesia
- Dr. Susumu Ishihara, Shizuoka University, Japan
- Dr. Suwadi Suwadi, ITS, Indonesia
- Dr. Suyong Eum, OSAKA University, Japan
- Dr. Swades De, Indian Institute of Technology Delhi, India
- Dr. T. Aaron Gulliver, University of Victoria, Canada
- Dr. Takashi Kurimoto, NII, Japan
- Dr. Takehiro Tsuritani, KDDI R&D Laboratories, Inc., Japan
- Dr. Takuji Tachibana, University of Fukui, Japan
- Dr. Tamer Nadeem, Old Dominion University, USA
- Dr. Tarek Sheltami, KFUPM, Saudi Arabia
- Dr. Tatsuya Shimada, NTT, Japan
- Dr. Teruyuki Hasegawa, KDDI R&D Laboratories Inc., Japan
- Dr. Tetsuya Yokotani, Kanazawa Institute of Technology, Japan
- Dr. Thang Manh Hoang, Hanoi University of Science and Technology, Vietnam
- Dr. Tibor Cinkler, Budapest University of Technology and Economics, Hungary
- Dr. Tom H. Luan, School of Information Technology, Australia
- Dr. Tony Sahara, Queensland University of Technology, Australia
- Dr. Truong Cong Thanh, The University of Aizu, Japan
- Dr. Tutun Juhana, Institut Teknologi Bandung, Indonesia
- Dr. Vasilis Friderikos, King's College London, United Kingdom
- Dr. Ved Kafle, National Institute of Information and Communications Technology (NICT), Japan
- Dr. Vincenzo Eramo, University of Rome "La Sapienza", Italy
- Dr. Visvasuresh Victor Govindaswamy, Concordia University, USA
- Dr. Wai Pang Ng, Northumbria University, United Kingdom
- Dr. Wan Tang, South-Central University for Nationalities, P.R. China
- Dr. Wei Ding, Florida Polytechnic University, USA
- Dr. Wei Guo, Shanghai Jiao Tong University, P.R. China
- Dr. Wei Liu, University of Sheffield, United Kingdom
- Dr. Wei Yuan, Huazhong University of Science and Technology, P.R. China
- Dr. Weihua Gao, Qualcomm Inc., USA
- Dr. Weihuang Fu, Cisco Systems, USA
- Dr. Weisi Guo, University of Warwick, United Kingdom
- Dr. Weiwen Zhang, Institute of High Performance Computing, Singapore
- Dr. Wenda Ni, Viscore Technologies Inc, Canada
- Dr. Wenjing Wang, Blue Coat Systems Inc., USA
- Dr. Wirawan Wirawan, Institut Teknologi Sepuluh Nopember, Indonesia
- Dr. Xavier Costa-Perez, NEC Laboratories Europe, Germany
- Dr. Xavier Masip-Bruin, Universitat Politècnica de Catalunya, Spain
- Dr. Xiang Gui, Massey University, New Zealand
- Dr. Xiang-Gen Xia, University of Delaware, USA
- Dr. Xiangbin Yu, Nanjing University of Aeronautics and Astronautics, P.R. China
- Dr. Xianming Qing, Institute for Infocomm Research, Singapore
- Dr. Xiaobing Wu, University of Canterbury, New Zealand
- Dr. Xiaojun Hei, Huazhong University of Science and Technology, P.R. China
- Dr. Xiaotian Zhou, Shandong University, P.R. China
- Dr. Xinbing Wang, Shanghai Jiaotong University, P.R. China
- Dr. Xinrong Li, University of North Texas, USA
- Dr. Xinyi Huang, Fujian Normal University, Singapore
- Dr. Xueli An, Huawei Technologies, Germany
- Dr. Xuetao Wei, University of Cincinnati, USA
- Dr. Yali Liu, AT&T Labs, USA
- Dr. Yasin Kabalci, Nigde University, Turkey
- Dr. Yasir Faheem, COMSATS Institute of Information Technology, Pakistan
- Dr. Yawei Yin, NEC Laboratories America, Inc., USA
- Dr. Yi Gai, Intel Labs, USA
- Dr. Yi Hong, Monash University, Australia
- Dr. Yik-Chung Wu, The University of Hong Kong, Hong Kong
- Dr. Ying Zhang, Hewlett Packard Labs, USA
- Dr. Yoan Shin, Soongsil University, Korea
- Dr. Yongli Zhao, Beijing University of Posts and Telecommunications, P.R. China
- Dr. Yoshiaki Kitaguchi, Information Medea Center, Kanazawa University, Japan
- Dr. Yoshihiro Ohba, Toshiba, Japan
- Dr. Yoshihisa Kishiyama, NTT DOCOMO, INC., Japan
- Dr. Yoshito Kanamori, University of Alaska, Anchorage, USA
- Dr. Yosuke Tanigawa, Osaka Prefecture University, Japan

Dr. Yuan-Kang Shih, Foxconn Advanced Communication Academy
(FACA), Taiwan
Dr. Yuansong Qiao, Athlone Institute of Technology, Ireland
Dr. Yue Gao, Queen Mary University of London, United Kingdom
Dr. Yufeng Xin, Renaissance Computing Institute (RENCI), USA
Dr. Yuli Yang, University of Chester, United Kingdom
Dr. Yuliang Tang, Xiamen University, P.R. China
Dr. Yupeng Jia, AT&T, USA
Dr. Yuuichi Teranishi, NICT, Japan
Dr. Yvon Gourhant, Orange Labs, France
Dr. Zheming Xu, Broadcom Limited, USA
Dr. Zhenchuan Chai, SK HYNIX MEMORY SOLUTION, USA
Dr. Zhiqiang Wu, Wright State University, USA
Dr. Zhongshan Zhang, University of Science and Technology Beijing
(USTB), P.R. China
Dr. Zubair Fadlullah, Tohoku University, Japan
Dr. Zuqing Zhu, University of Science and Technology of China, P.R.
China
Dr. Achmad Ali Muayyadi, Telkom University, Indonesia

Program at a Glance

Day One: Thursday, 25 August 2016

| Hours | KARATON BALLROOM | PEMANDENGAN 1 | PEMANDENGAN 2 | PEMANDENGAN 3 | PEMANDENGAN 4 |
|-------------|--|-----------------|---------------------------------|-------------------------------|-----------------------------------|
| 08.30-09.30 | Opening Session | | | | |
| 09.30-12.00 | Keynote Session Day One I | | | | |
| | Coffee Break | | | | |
| | Keynote Session Day One II | | | | |
| | Keynote Session Day One III | | | | |
| 12.00-13.00 | LUNCH at ROYAL RESTAURANT on Lobby Level | | | | |
| 13.00-17.30 | Tutorial Session Day One I & II | Optical Session | 4G Enhancement & 5G (A) Session | Antenna & Propagation Session | Cloud Computing & IoT (A) Session |
| | Coffee Break | Coffee Break | Coffee Break | | Coffee Break |
| | Tutorial Session Day One III | ASC Meeting | 4G Enhancement & 5G (B) Session | | Cloud Computing & IoT (B) Session |
| 18.30-end | GALA DINNER at PENDOPO on Lobby Level | | | | |

Day Two: Friday, 26 August 2016

| Hours | KARATON BALLROOM | PEMANDENGAN 1 | PEMANDENGAN 2 | PEMANDENGAN 3 | PEMANDENGAN 4 |
|-------------|--|----------------------|----------------------|----------------------|------------------------------------|
| 08.30-12.00 | Keynote Session Day Two I, II, III | | | | |
| | Coffee Break | | | | |
| | Keynote Session Day Two IV, V, VI | | | | |
| 12.00-13.30 | LUNCH at ROYAL RESTAURANT on Lobby Level | | | | |
| 13.30-17.30 | Poster Session | Networks (A) Session | Networks (C) Session | Wireless (A) Session | Wireless Signal Processing Session |
| | Tutorial Session Day Two I & II | | | | |
| | Coffee Break | Coffee Break | Coffee Break | Coffee Break | |
| | Tutorial Session Day Two III | Networks (B) Session | Services Session | Wireless (B) Session | |

| Sunrise Tour to Borobudur (Start 03.00 AM – Finish 10.00 AM) | |
|---|--|
| 03.00 | Departure from Ambarrukmo hotel, transfer directly to Borobudur |
| 04.00 | Arrive in Borobudur, after get the entrance ticket at Manohara, climb up to enjoy the sunrise on the third level of Borobudur temple or on the top of Borobudur temple |
| 05.00 | Enjoy the Sunrise, see the magnificent panoramic view around the Borobudur temple |
| 06.00 | Visit the temple, see the relief of the Buddha life depicting on the wall of the temple |
| 07.30 | Back to Manohara to take morning café |
| 08.00 | Transfer to Ambarrukmo Hotel, on the way we may stop over on the Mendut temple (where 3 the temple with big statue temple in one stone are) |
| 10.00 | Arrive at Ambarrukmo Hotel |

| Industry Visit : Jogja Digital Valley (Start 13.00 – Finish 17.10) | | |
|---|--|---|
| 13.00 | Meeting at Royal Ambarrukmo Hotel lobby, venue of APCC 2016 | |
| 13.10-13.50 | Travel from Royal Ambarrukmo Hotel to Jogja Digital Valley | |
| 13.50-14.00 | Opening by Jogja Digital Valley and Participant Introduction | |
| 14.00-16.20 | Generation X and Generation Y Perception Towards Internet of Things in Public Service <i>by Rino Ardhian Nugroho, Sebelas Maret University, INDONESIA</i> | Data Location Aware Scheduling for Virtual Hadoop Cluster Deployment on Private Cloud Computing Environment <i>by Anang Hudaya H Muhamad Amin, Multimedia University, MALAYSIA</i> |
| | Model to Determine the Contribution of Own Source Revenue Towards Regional Government <i>by: Sugiarto Hartono, Bina Nusantara University, INDONESIA</i> | Demonstration of Vulnerabilities in GSM Security with USRP B200 and Open-Source Penetration Tools <i>by Arusha Dubey, Nirma University, INDIA</i> |
| | Join My Group: Evidences of Whatsapp Use to Run a Better Breakfast Streetfood Business <i>by Nora Amal, Sebelas Maret University, INDONESIA</i> | A Location-Aware Authentication and Key Management Scheme for Wireless Sensor Network <i>by Walid Abdallah, University of Carthage, TUNISIA</i> |
| 16.20-16.30 | Closing and Photo Session | |
| 16.30-17.10 | Travel from Jogja Digital Valley to Royal Ambarrukmo Hotel | |

Keynote Sessions

Day One: Thursday, 25 August 2016, 09.30 – 12.00, KARATON BALLROOM

Wireless Big Data: Transforming Cognitive Radios to Smart Networks

Ying-Chang Liang
University of Electronic Science and Technology of China

Research Collaboration in 4G/5G Mobile Networks

Kumbesan Sandrasegaran
University of Technology, Sydney, Australia

Optically powered radio-over-fiber system using double-clad fibers

Motoharu Matsuura
University of Electro-Communications, Japan

Day Two: Friday, 26 August 2016, 08.30 – 12.00, KARATON BALLROOM

Innovation on Media & Digital Business

Indra Utoyo
Director of Digital & Strategic Portfolio,
PT.Telkom - Indonesia

5G Access Technologies in Terrestrial and Satellite Communications

Eiji Okamoto
Nagoya Institute of Technology, Japan

Reliability Analysis of the IoT Network.

Jae-Hyun Park
Chung-Ang University, South Korea

Low Complexity Iterative Receiver Design for Sparse Code Multiple Access

Wen Chen
Shanghai Jiao Tong University, China

Block Codes for Two-Dimensional Magnetic Recording

Hiroshi Kamabe
Gifu University, Japan

Research and Innovation Opportunities in Changing Air Transport

Pavel Loskot
Swansea University, UK

Tutorial Sessions

Day One: Thursday, 25 August 2016, 13.00 – 17.30, KARATON BALLROOM

Extrinsic Information Transfer (EXIT) Analysis: From Point-to-Point Physical Encoding to Super-Dense Network Encoding

[Khoirul Anwar](#)
Telkom University, Indonesia

Location Estimation in Indoor Environment

[Eisuke Kudoh](#)
Tohoku Institute of Technology, Japan

IoT Security and Privacy

[Robin Doss](#)
Deakin University, Australia

Day Two: Friday, 26 August 2016, 14.30 – 17.30, KARATON BALLROOM

Open APIs

[Andri Qiantori](#)
Telkom Indonesia

Wireless Power Transfer for Automated Guided Vehicles

[Minoru Okada](#)
Nara Institute of Science and Technology, Japan

Signals and Systems with Graphs

[Pavel Loskot](#)
Swansea University, UK

TABLE OF PAPERS

| No. | Title | Page Number |
|-----|---|-------------|
| 1 | Study on Protocol and Required Bandwidth for 5G Mobile Fronthaul in C-RAN Architecture with MAC-PHY Split | 1 |
| 2 | Random Linear Fountain Code with Improved Decoding Success Probability | 6 |
| 3 | Selection Model Based on Multi-Objective Evolutionary Algorithm for Coordinated Multi Point Schemes | 12 |
| 4 | Benchmarking of Real-Time LTE Network in Dynamic Environment | 20 |
| 5 | Making Preamble Shorter in OFDM Real-Time Wireless Control Systems | 26 |
| 6 | A Multiple PRS Transmission Based Quantization Error Reduction for 3GPP LTE Systems | 32 |
| 7 | Power Amplifier Configuration for Massive-MIMO Transmitter | 38 |
| 8 | Monopole-Like Meander Microstrip Antenna Onboard Microsatellite for Telecommand Applications | 44 |
| 9 | Effect of Partial Groundplane on 4-Element MIMO Antenna Performance for 2300 MHz (Band 40) | 49 |
| 10 | Evaluation of Antenna Performance for Use in Wide Band Wireless Protocols | 54 |
| 11 | Stacked Ultra Wide Band Ring Rectangular Microstrip Antenna Fed by Coplanar Waveguide | 62 |
| 12 | Input Impedance Model of Planar Dipole Antenna for Wireless Body Area Network (WBAN) | 66 |
| 13 | Design of Microstrip Antenna for Data Serial Communication | 70 |
| 14 | Secrecy Outage Probability of Dual-hop DF Cognitive Relay Networks Under Interference Constraints | 76 |
| 15 | Multiband Scheme Design for Multiple NBIs Suppression Based OS-OCC UWB System | 81 |
| 16 | Side Lobe Suppression for X-Band Array Antenna Using Dolph-Chebyshev Power Distribution | 86 |
| 17 | Aware-D: Voice Recognition-based Driving Awareness Detection | 90 |
| 18 | Joint Decoding for Multiway Multirelay Networks with Coded Random Access | 96 |
| 19 | Data Location Aware Scheduling for Virtual Hadoop Cluster Deployment on Private Cloud Computing Environment | 103 |
| 20 | Generation X and Generation Y Perception Towards Internet of Things in Public Service | 110 |
| 21 | Internet of Things: Over-the-Air (OTA) Firmware Update in Lightweight Mesh Network Protocol for Smart Urban Development | 115 |
| 22 | Join My Group: Evidences of Whatsapp Use to Run a Better Breakfast Streetfood Business | 119 |
| 23 | Evaluation of Cluster K-Means as VM Selection in Dynamic VM Consolidation | 124 |
| 24 | A Simple M-branch Diversity Receiver Model for PMD-induced Penalty Mitigation in IM-DD Optical Transmission Systems | 129 |
| 25 | Evaluation of Block Turbo Codes for Long-Haul Optical Networks | 134 |
| 26 | Optimisation of Second Harmonic Generation by Using Photonic Crystal Cavity | 139 |
| 27 | Slow Light Optimization in Symmetric Photonic Crystal Waveguide with Elliptical Holes | 144 |
| 28 | Performance Analysis of a 2 Tb/s DWDM System Based on Narrow Channel Spacing and Multi-Diagonal Code | 148 |
| 29 | An Optical Wireless Network for Railways Condition Monitoring | 153 |
| 30 | Performance of 40, 80 and 112 Gb/s PDM-DQPSK Optical Label Switching System with Spectral Amplitude Code Labels | 161 |
| 31 | A Power-Distance Based Handover Triggering Algorithm for LTE-R Using WINNERII-D2a Channel Model | 167 |
| 32 | Interference-Limited Radio Resources Allocation in LTE-A System with MIH Cooperation | 174 |
| 33 | Performance Analysis of Low Complexity Multi-User MIMO Scheduling Schemes for Massive MIMO System | 180 |
| 34 | Performance Comparison of Packet Scheduling Algorithms in LTE-A HetNets | 185 |
| 35 | A Dynamic Resource Allocation Scheme in Femtocell Networks Considering User Mobility | 191 |

| | | |
|----|---|-----|
| 36 | An Optimized LTE Measurement Handover Procedure for High Speed Trains Using WINNERII Channel Model | 197 |
| 37 | Deployment Models: Enhancing Security in Cloud Computing Environment | 204 |
| 38 | Access Control Framework for API-Enabled Devices in Smart Buildings | 210 |
| 39 | Model to Determine the Contribution of Own Source Revenue Towards Regional Government | 218 |
| 40 | Cooperative Sensor-Clouds for Public Safety Services in Infrastructure-less Areas | 222 |
| 41 | A Novel Monitoring Solution for 6LoWPAN-based Wireless Sensor Networks | 230 |
| 42 | Performance Modeling and Evaluation of Real-time Traffic Status Query for Intelligent Traffic Systems | 238 |
| 43 | Modeling and Evaluating IaaS Cloud Using Performance Evaluation Process Algebra | 243 |
| 44 | Multi-attribute Aware Multipath Data Scheduling Strategy for Efficient MPTCP-based Data Delivery | 248 |
| 45 | On the Implementation of Path-Based Dynamic Pricing in Edge-Directed Routing | 254 |
| 46 | Carry Me If You Can: A Utility Based Forwarding Scheme for Content Sharing in Tourist Destinations | 261 |
| 47 | A Simple Algorithm of Centralized Flow Management for Data Centers | 268 |

SCOPE

It is our great pleasure and honor to welcome you to APCC 2016, the 22nd Asia-Pacific Conference on Communications and also to our beautiful Yogyakarta, the center of Javanese arts and culture. In this event we will have the opportunities to exchange knowledge and information on latest researches and strengthening relationships amongst us, while enjoying the relaxing yet entertaining environment of Yogyakarta.[...] Many advance technologies in the communication field, start to put the intelligences in many components and subsystems of a communication system. Novel methods, devices and

in many segments and subsystems of a communication system. novel methodologies and approaches are introduced to achieve higher level of communication quality. Nevertheless, human life is still a very important aspect to be considered in each development of technologies, including communication technology. Today, we have witnessed the rise of broad smart digital technologies on the devices, sensors, networks, controls and not to mentions millions of applications. Those smart technologies spun from computing, broadcasting and media, platforms, applications and contents, advertising and social media. Accordingly, under the theme of "Advancement of Science, Technology and Applications in Communications for Humanity", APCC 2016 will provide opportunity for us to discuss this issue. Still, there are many challenges need to resolve, including technology, infrastructure, traffic, spectrum, privacy/security, energy-efficiency, nature-friendly development, life style changes, and others.

The users of Scimago Journal & Country Rank have the possibility to dialogue through comments linked to a specific journal. The purpose is to have a forum in which general doubts about the processes of publication in the journal, experiences and other issues derived from the publication of papers are resolved. For topics on particular articles, maintain the dialogue through the usual channels with your editor.

A Filtering Concept for Improving the Angle-based Forwarding Scheme in Vehicular Ad-hoc Network Communications

Lisa Kristiana, Corinna Schmitt, Burkhard Stiller

Communication Systems Group CSG, Department of Informatics IFI, University of Zurich UZH
Binzmühlestrasse 14, CH—8050 Zurich, Switzerland
[kristiana|schmitt|stiller]@ifi.uzh.ch

Abstract—Vehicular Ad-hoc Network (VANET) communications are mobile communication alternatives allowing vehicles to exchange information among them with a suitable forwarding scheme. The forwarding scheme is a mechanism to select proper candidate nodes as the intermediate node. Current angle-based forwarding schemes take into account a Horizontal Relative Angle (HRA) and propose Vertical Relative Angle (VRA) as an alternative. The introduction of a filtering concept, implementing both HRA and VRA, restricts the number of insignificant candidates. Under various VANET communication factors (e.g., network density, mobility, and road level topology) the work presented here investigates the VRA scheme to improve the forwarding decision especially in the three-dimensional case within a large city environment.

Index Terms—Vehicular-to-Vehicular (V2V) networks, Vertical Relative Angle (VRA), Horizontal Relative Angle (HRA), Vehicular Ad-hoc Network (VANET), Forwarding scheme

I. INTRODUCTION

The population in cities rises in close relation to the development of public transport and mobility demands of the population. However, many people prefer to use their own car for comfort reasons, when commuting. In order to convince them to use public transportation, incentives beyond financial issues must be provided. One such incentive can be personal network connectivity (e.g., Internet access for social media access, messaging services, or news updates) because most people own Smartphones [2] and it was proven that this has an effect on people's behavior [1]. Thus, the support of Internet connectivity is the key incentive assumed here to convince people to use public transport. When applying those ideas to countries like Indonesia, people can be convinced additionally when this service is free of charge, furthermore resulting in less traffic on the roads.

The solution of providing Internet connectivity is inspired by the principle of Vehicular Ad-hoc networks (VANETs). VANETs can form either Vehicular-to-Vehicular (V2V) or Vehicular-to-Infrastructure (V2I) approaches both offering several applications to support the driver, passenger, and vehicles [4]. The safety application *i.e.* car crash prevention, takes into account of short range wireless transmission technology *i.e.*, Dedicated Short Range Communication (DSRC) [6]. Non-safety applications, *i.e.*, Web surfing and social networking, are the other interesting aspect to explore, and they can

Fig. 1. Scenario in a large city environment

use other options of unlicensed spectrum such as Wi-Fi or WiMAX [30]. The integration of non-safety application using Wi-Fi is even possible to be implemented in V2V [3], [6], also known as inter-vehicular networks [5].

The successful transmission of data is the main goal of the routing mechanism, which additionally can be complemented with Quality-of-Service (QoS) parameters, including throughput and stable data rates [7]. However, maintaining QoS brings trade-offs (e.g., communication delay and number of hops) [8] that need to be investigated. Existing research has implemented and simulated a realistic city environment [9], [10]. To the best of the author's knowledge, the two-dimensional case is used in the majority of scenarios, since vehicles move on the road, *i.e.*, not considering ramps or overpasses. Thus, this work here focuses on the three-dimensional case within a city environment [12], [14], which considers the altitude position coordinate as a new key element in terms of location information as illustrated in Fig. 1 [26]. In order to improve a reliable and stable transmission of data, three research questions are to be investigated:

(i) How stable and reliable is the connectivity in a three dimensional environment? The three-dimensional environment is shown in Fig. 1 including key parameters in V2V communications, such as the impact of obstacles (e.g., buildings, trees, overpass, and other vehicles [16]) in this environment. The modelling of the scenario of a large city environment covers here the complexity of propagation and considering the details of overpasses [11], [13].

(ii) How feasible is Wi-Fi in a V2V communication? Thus, the performance of IEEE 802.11b/g [17] for different road-level topologies [13] and non-safety application integration issues is investigated. In addition, the duration of connection is also investigated.

(iii) How to improve the forwarding strategy with respect to such a three-dimensional environment? Thus, selecting the proper intermediate node based on distance and angle measurement among cars are considered [9], [32].

The reminder of this paper in Section 2 discusses the related work. Section 3 proposes the filtering concept by applying the Vertical Relative Angle (VRA) scheme and its initial modeling. The evaluation in Section 4 is followed by the summary and a future work perspective in Section 5.

II. RELATED WORK

A reliable and stable V2V communication refers to a successful delivery of messages [8] and immediately finding the new path due to frequent changing topology. In V2V, any participant vehicles can behave as source node S , receiver node R , or relay I . The degree of successful delivery is defined by the high percentage of packet delivery ratio (PDR). The routing process requires proper calculation of weights (*e.g.*, hop counts, link quality, delay constraint, geographical distances, or signal strength) for each path foreseen to decide upon the “best” path to transmit relevant information from S to R . The decision of this process is handed over to the forwarding scheme, which utilizes local port information of a relay to forward packets [19].

In order to design the appropriate forwarding scheme, it is necessary to consider various factors of VANETs communications [27]. Those factors include the environment, network type, and mobility as shown in Fig. 2. The environment factor describes characteristics of road topologies, which are classified as a two-dimensional case *i.e.*, the highway or city roads with intersections [9], [10] or as a three-dimensional case *i.e.*, overpass or underpass [11], [13]. The second factor is the network type, which is based on the number of participating nodes and divided into a dense network, which involves many vehicles as participating nodes and a sparse network, which lacks of active participating nodes [18]. The third factor is the mobility, which can be classified by participant nodes with a high or low speed and with random or non-random directions [18]. However, in case of VANET, vehicles have non-random directions since vehicles move on pre-defined road path. In order to address those VANET communication factors, several related works in establishing communication among vehicles are discussed in following:

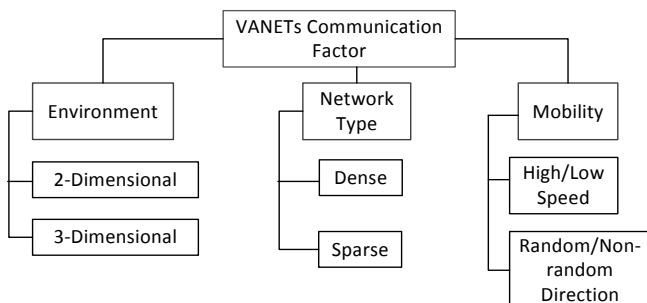

Fig. 2. VANETs Communication Factor

A. Transmission Range

The transmission range in the three-dimensional case is different compared to two-dimensional case because the height of the road topology does impact the transmission range [13]. Fig. 3 illustrates the maximum transmission range in a three-dimensional perspective. The transmission range of S , can cover both on different road level topologies with several requirements are discussed in the two section below.

Fig. 3. Transmission Range in Three-dimensional Perspective

B. Wireless Communication Technology

In V2V, the term mobile node represents a vehicle and it is assumed to be equipped with a navigation system as Global Positioning System (GPS) and wireless communication (Wi-Fi/IEEE 802.11b/g), therefore, the term mobile node and vehicle can be used alternately.

In V2V network, Wi-Fi/IEEE 802.11 as a short-to-medium range radio technology is possible to be used to establish a communication among vehicles [17]. A Wi-Fi ad-hoc mode can support inter-vehicular networking through the ad-hoc broadcast [29]. This communication technology has been enhanced for non-safety applications with required modification since it has to support communication among vehicles moving at high speeds [30].

C. Propagation Model

The characteristic of a propagation channel may vary depending on the environment and influences both signal transmission and reception. A consideration of a propagation model that is influenced by the existence of obstacles is proposed as an approach to obtain an optimum transmission [31]. In case of buildings, composed out of a concrete block, signal transmission will be attenuated or even restricted [21]. In case of overpasses, it is assumed that the overpass is not made from material with good conductivity, thus, signals attenuate or are restricted along the overpass [20].

By definition, signal transmissions that enter the overpass are assumed as a signal loss since they do fade and distract, depending on the overpass' length *e.g.*, GPS signal for navigation systems and Wi-Fi signals degradation [21]. The longer the overpass, the signal loss probability rises and the signal reception is decreased. There is a trade-off whether to disconnect the transmission and search for a new connection or to maintain the current and distracted connection *i.e.*, when a vehicle moves below an overpass with high speed, but suddenly decreases the speed due to traffic conditions, the distracted connection expands or the vehicle becomes temporary unreachable [19].

It is important to define the particular environment as a preliminary set up. In a free space environment (*i.e.* the environment where the electromagnetic wave transmits without any obstructions), the propagation channel is considered as the line-of-sight (LOS) propagation model. This model determines a theoretical case and is used as a reference for other propagation models. In case of the urban environment topology, the propagation channel is modeled as a path loss propagation model [20]. This model takes into account buildings and assumes electromagnetic waves are diffracted [21]. In case of other objects, *e.g.*, an overpass, the propagation model is assumed as the obstacle propagation model. This model assumes that electromagnetic waves are blocked by the overpass [13]. This work combines the non-line-of-sight (NLOS) propagation and obstacle propagation model in order to obtain a realistic propagation of a large city environment.

D. Angle Forwarding Scheme

A forwarding scheme has various methods that rely on positions [22]. The initial assumption holds that all nodes are equipped with GPS, therefore, all nodes know their current position and the position of their neighbors within their communication range (*i.e.*, transmission range, where the communication process is assumed to be successful).

Fig. 4. Forwarding Scheme

As there exists 3 types of forwarding schemes based on such a position information, each of them is presented below.

Most Forwarding Scheme (MFS), calculates the path from a source S to its neighbors in order to obtain the best path to the receiver R . The way this forwarding scheme calculates the distance from S to R by forming the imaginary line between S and R , as illustrated in Fig. 4. The MFS selects the intermediate node (I), which has the closest distance to the receiver amongst the forwarding nodes within the transmission range of a source node. Therefore, A is selected by S and A becomes the intermediate node because A fulfills aforementioned requirement [22].

Near Forwarding Scheme (NFS), Basically, this scheme is the opposite to MFS since NFS selects the intermediate node that has the closest distance to S (c.f. Fig. 4). Therefore, the intermediate node is indicated as node B [22].

The Angle Forwarding Scheme (AFS) relies on an angle calculation. An angle θ is a shape formed by two straight lines, S to R and S to C , that have a vertex as illustrated in Fig. 4. [22]. Based on the imaginary line, AFS provides an additional measurement metric, which is known as the relative angle [23], [24], [25].

III. FILTERING CONCEPT

The three-dimensional case determines the additional location coordinate *i.e.*, altitude, to the existing location in the two-dimensional case *i.e.*, latitude and longitude. The altitude is the important parameter to signal reception calculation since it indicates the distance parameter in three-dimensional case. Due to the fact of location coordinates in three-dimensional case, the filtering concept applies both HRA and VRA introduced as follows:

A. Vertical Relative Angle

Relative angles in degrees are measured in two ways: First, the angle θ_x is measured between the positive x -axis and positive y -axis. Second, the angle θ_z is measured between the positive z -axis and the imaginary line. Here the angle θ_x is defined as HRA and the angle θ_z is defined as VRA.

Fig. 5. Vertical Relative Angle and Horizontal Relative Angle

The **imaginary line** for two- and three-dimensional areas, which is formed by line S and R , represents the dashed line k as shown in Fig. 5. The j line is also an imaginary line formed between S (*i.e.*, in case of S has zero value in both x and y -axis) and R based on the x and y -axis, while k line is formed between S and R based on the z , y and x -axis. Therefore, the location coordinate of S and R are $S(x_S, y_S)$ and $R(x_R, y_R)$ in the two-dimensional area, while $S(x_S, y_S, z_S)$ and $R(x_R, y_R, z_R)$ determine those in the three-dimensional area. Based on these location coordinates, the imaginary line can be defined generally as Equation 1 and 2.

$$\Delta j = \sqrt{(x_R - x_S)^2 + (y_R - y_S)^2} \quad (1)$$

$$\Delta k = \sqrt{(x_R - x_S)^2 + (y_R - y_S)^2 + (z_R - z_S)^2} \quad (2)$$

$$\theta = \text{acos}\left(\frac{SR \cdot SR}{|SR| \times |SR|}\right) \quad (3)$$

Given h , j , and k (cf. Fig. 5), angles θ_x and θ_z are calculated by Eqn. 3. Thus, the relative angle is defined as the angle measured between the imaginary line and the current node. Thus, relative angle various angle-based forwarding schemes can be designed addressing key network characteristics [27].

B. Filtering Scheme

The concept of filtering scheme is introduced in two steps. The first step is to select the proper candidates as the in-

intermediate node in two-dimensional case, by implementing HRA. This filtering concept selects the candidates within the S transmission range, by restricting the searching area. The HRA implementation as illustrated in Fig. 6 defines the θ_l as the maximum angle of transmission area. The value of θ_l decreases to θ_3 in order to restrict candidates and select the node which is located closest to R .

Fig. 6. Filtering Concept using HRA

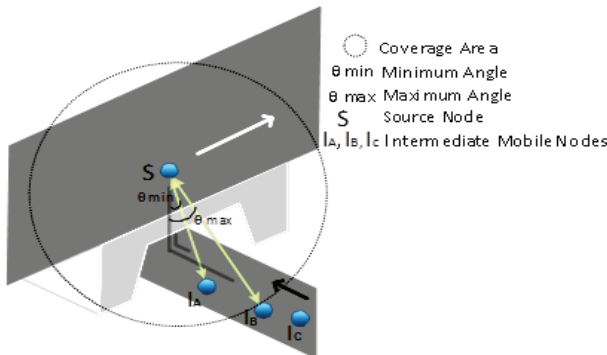

Fig. 7. Filtering Concept using VRA

The second step is the VRA implementation in the three-dimensional case. The minimum and maximum angles are denoted as θ_{min} and θ_{max} . Under the assumption that intermediate nodes (I nodes) are within the transmission range of S , these θ_{min} and θ_{max} angles determine which intermediate node becomes the next forwarding node. The selection of candidates located within the θ_{min} area is avoided, since nodes within this area will experience the disconnection status soon. The preference area of the VRA forwarding scheme is between θ_{min} and θ_{max} . Thus, the VRA scheme will only transmit packets, if intermediate nodes are within this area. The HRA and VRA (*i.e.*, relative angles) schemes are combined in order to cope with both two-dimensional and three-dimensional cases. The detailed algorithm of the filtering scheme is shown in Fig. 8.

IV. EVALUATION

The evaluation of filtering concept implementing HRA and VRA in V2V scenario started with the parameter settings listed in Table I. The Network Simulator-3 (NS-3) [28] is used to generate specific condition and environment, such as wireless technology (*i.e.*, IEEE 802.11b/g), routing protocol (*i.e.*, Greedy Perimeter Source Routing (GPSR) [22]), mobili-

```

S ← sender node
R ← receiver node
I all neighboring nodes of S
 $\theta_{h,max}$  ← maximum boundary of the
           horizontal angle
 $\theta_{v,min}$  ← minimum boundary of the
           vertical angle
 $\theta_{v,max}$  ← maximum boundary of the
           vertical angle
for all I
 $\theta_h$  ← horizontal angle made by n to S
 $\theta_v$  ← vertical angle made by n to S
 $I_{filtered}$  ← only I that is
              within  $[-\theta_{h,max}, \theta_{h,max}]$ 
              and  $[\theta_{v,min}, \theta_{v,max}]$ 
end for
d ← distance from  $I_{filtered}$  to R
next_hop ← arg_min(d)
    
```

Fig. 8. Algorithm 1 Filtering Scheme

To obtain a realistic speed of vehicles in a large city environment, the average speed of vehicles is set between 40 and 70 km/h, high and sparse density, various type of obstacles (*i.e.*, building and overpass construction), and the direction of vehicles is usually a non-random way due to the natural vehicle movement on predefined lanes. Various numbers of nodes are simulated to investigate the effect of network's density. Pairs of connections (*i.e.*, S to R) are generated randomly, which means that any participant nodes can be S or R , and/or I . The number of S and R are generated linearly, which means a 40 nodes network contains of 20 senders and 20 receivers. In addition, S , R , and I are placed randomly both on two different road level. The simulation area covers an environment that involves a road with an overpass crossing in the middle and buildings which are located on the road side. While the evaluations' impacts onto the Packet Delivery Ratio (PDR) are addressed, the simulation time is set to 200 s in order to obtain the required transmission time for realistic packet sizes and the expected round trip distance of vehicles within two driving lanes. Finally, the particular use case is defined for Jakarta, Indonesia due to a specific mobility model, traffic behaviour and velocity, road level topology, and the author's fellowship granted by the Indonesian Government.

TABLE I: PARAMETER SETTINGS

| Parameter | Units |
|--------------------------------|---------------|
| Transmission Range IEEE 802.11 | 140 m |
| Number of Nodes | 10 - 40 |
| Simulation Area | 500 m x 500 m |
| Upper Road Height | 10 - 20 m |
| Average Vehicle Velocity | 40-70 km/h |
| Packet Size | 2048 Byte |
| Simulation Time | 200 s |
| Number of Driving Lanes | 2 |

The first result in Fig. 9 shows the impact of overpass construction in three-dimensional case and the impact of buildings in two-dimensional case to network performance. The

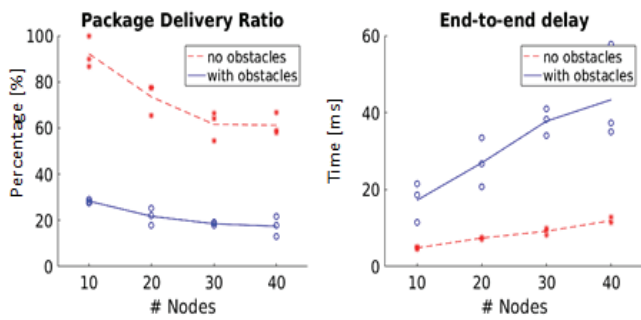

Fig. 9. Impact of Obstacle

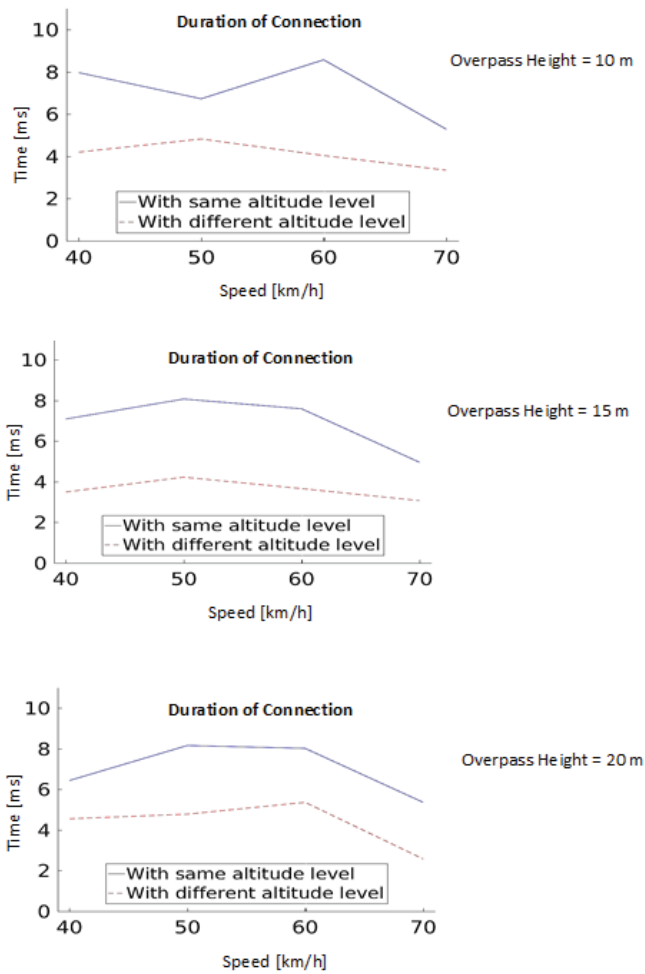

Fig. 10. Duration of connection

solid line describes the lower PDR that includes the existence of an obstacle and compares to the dashed line, which describes the PDR without an obstacle. The highest obtained PDR with obstacles is 30 percents, which is considerably low. The low PDR is caused by the overpass construction. Since the scenario which is under investigation focuses on the road topology with obstacles (*i.e.*, overpass constructions) are added between two different levels of roads, thus, those obstacles block the signal reception. Additionally, the chosen rout-

ing protocol, GPSR, and its search location mechanism considers vehicles, which are located under the overpass as “undetected” vehicles’ location coordinate. The end-to-end (E2E) delay indicates that the obstacle decreases the connectivity. Due to those findings, the following evaluations address all the network performance and takes into account the obstacle propagation model.

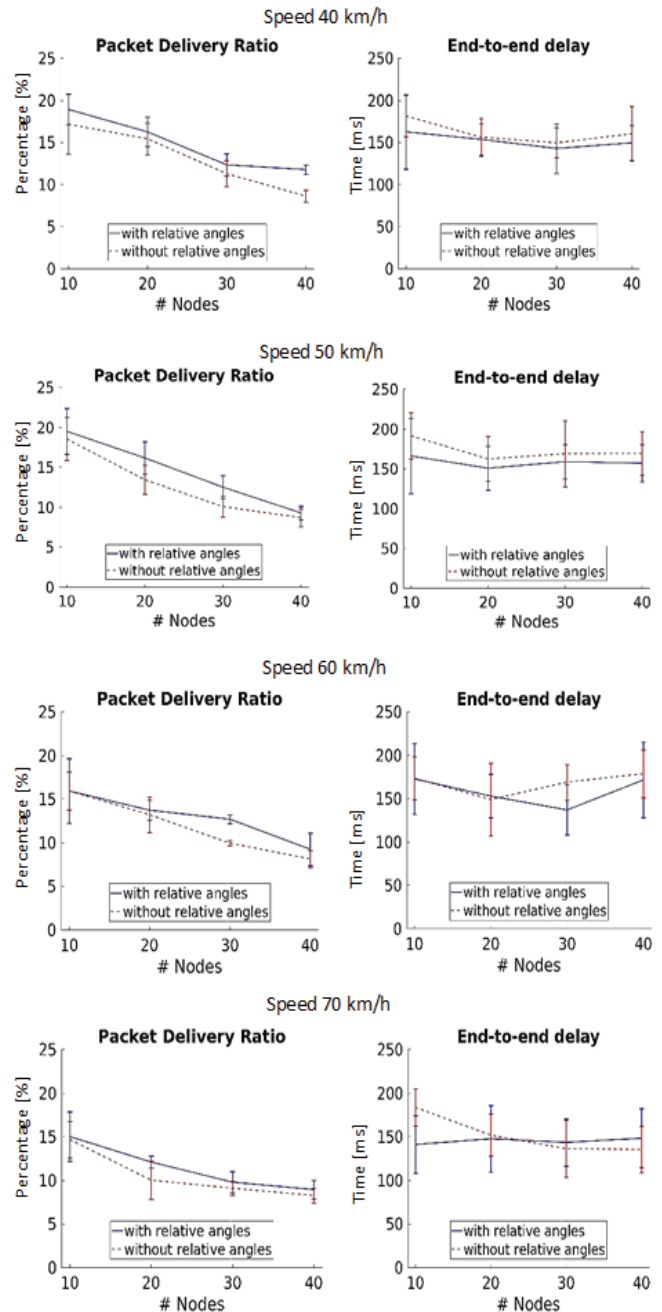

Fig. 11. HRA and VRA Implementation in Filtering Concept

The second result related to a different road level topology *i.e.*, vehicles located both on overpass and under overpass is shown in Fig. 10. The connectivity, indicated as millisecond (ms), among vehicles on the same altitude (*i.e.*

road level) has the longer duration than on the different altitude. This indicates that the altitude factor cannot be neglected, since vehicles obviously select the intermediate node within the suggested transmission range *i.e.*, the transmission range as defined in Section III.

By indicating the obstacle and the altitude, the filtering concept results are shown in Fig. 11. The solid blue lines indicate the implementation of filtering concept using the relative angle *i.e.*, VRA and HRA. The PDR of each speed shows that filtering reveals the better result compared to an unfiltering scheme. This indicates that involving the relative angle as the additional metric to the forwarding decision is necessary to determine a proper intermediate node out of available neighboring candidates. The highest obtained PDR is 20 percent and it is also considerably low due to the specific feature of the selected routing protocol which rely on the location coordinate of vehicle. Overall, the PDR is decreasing due to the higher speed of vehicles and due to frequent disconnections. However, the end-to-end delay considered has to be handled as a trade-off. The end-to-end delay shows fluctuating results (cf. Fig. 11) and has larger delays on average. The speed of vehicles has an insignificant impact to the end-to-end delay. Thus, the delay reached determines the result of the routing protocol mechanism searching for the new connection or path once the current path is disconnected or broken.

V. SUMMARY AND FUTURE WORK

This paper evaluated a V2V communication by improving the angle-based forwarding scheme. This V2V communication has potentials to provide non-safety applications in addition to safety applications. Obstacles decrease the network performance both in two-dimensional case and three-dimensional case. The proposed VRA combined with HRA shows a better packet reception by filtering candidates in a dense network. The filtering concept increases the effectiveness of locating the intermediate node, which subsequently minimizes the number of hops and reduces message overhead. While the transmission coverage is assumed to be evenly distributed, the situation is improved by applying VRA since it addresses the propagation loss and antenna type for evaluations.

In next steps, multiple lanes scenarios will be evaluated in depth to increase the understanding of VRA scenarios and derive applicable observations for the real Jakarta traffic and map. Moreover, besides IEEE 802.11a/n/g the IEEE 802.11p technology will be used additionally in simulations since it is designed to cope the frequent topology changes in a VANET characteristics. The interesting comparison will be investigated with respect to those different non-safety- vs. safety-critical applications.
